HOTELS

# Introduction

*This project focuses on evaluating the performance of a hotel chain using interactive Power BI dashboards. The analysis is built using four datasets—Reservations, Property Details, Room Information, and Occupancy Logs.*

*The goal is to understand guest behaviour, revenue flow, room utilization, and business performance across multiple hotel locations. By transforming raw datasets into meaningful insights, this project supports better decision-making in areas such as pricing, marketing, and operational planning.*

# Dataset Overview

## Reservations Data

*Contains details about guest bookings such as check-in/check-out dates, booking channel, number of guests, room category, payment status, and total amount charged.*

## Properties Data

*Includes information related to each hotel: property ID, name, location, type of hotel (luxury, business, budget), and other fixed attributes.*

## Rooms Data

*Provides room-level details like category (Classic, Deluxe, Suite, Executive), capacity, and pricing structure.*

## Occupancy Data

*Tracks room availability, daily occupancy, maximum capacity, and utilization across different times of the year.*

# Methodology

01

## Data Import

All four datasets were loaded into Power BI as the foundation for the analytics workflow.

02

## Data Cleaning

- Removed duplicate booking entries
- Standardized date formats using Power Query
- Filled missing values where necessary
- Created a Calendar Table for time intelligence analysis

03

## Data Modeling

Relationships were established using:

- Property ID
- Room Category
- Room ID (where applicable)

This star-schema model helped connect booking, occupancy, and property-level data smoothly.

04

## Creating DAX Measures

Custom KPIs were created using DAX, including:

- Total Revenue
- Occupancy Percentage
- Average Daily Rate (ADR)
- Revenue per Available Room (RevPAR)
- Average Stay Length
- Cancellation Rate
- Monthly and Weekly Growth Metrics

05

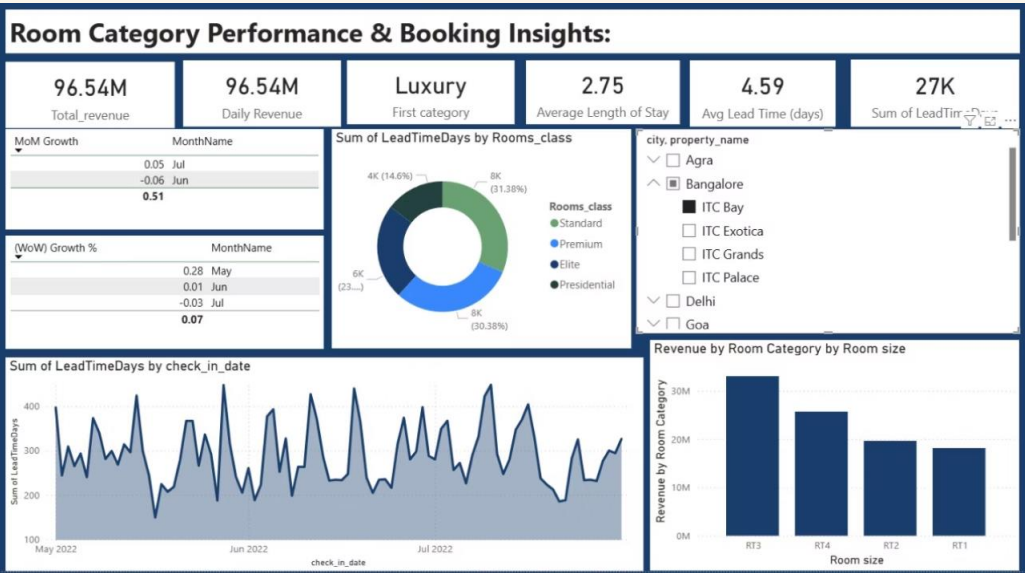

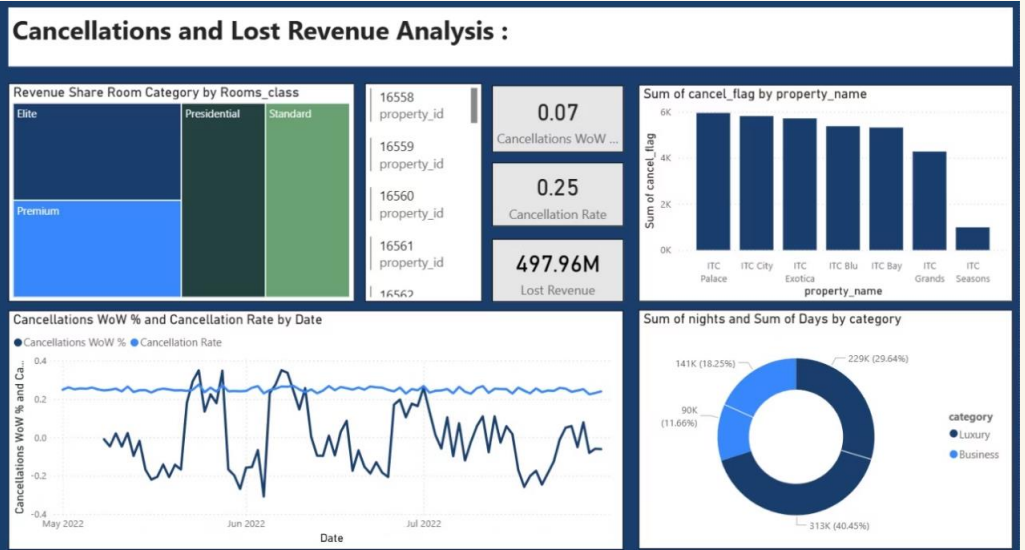

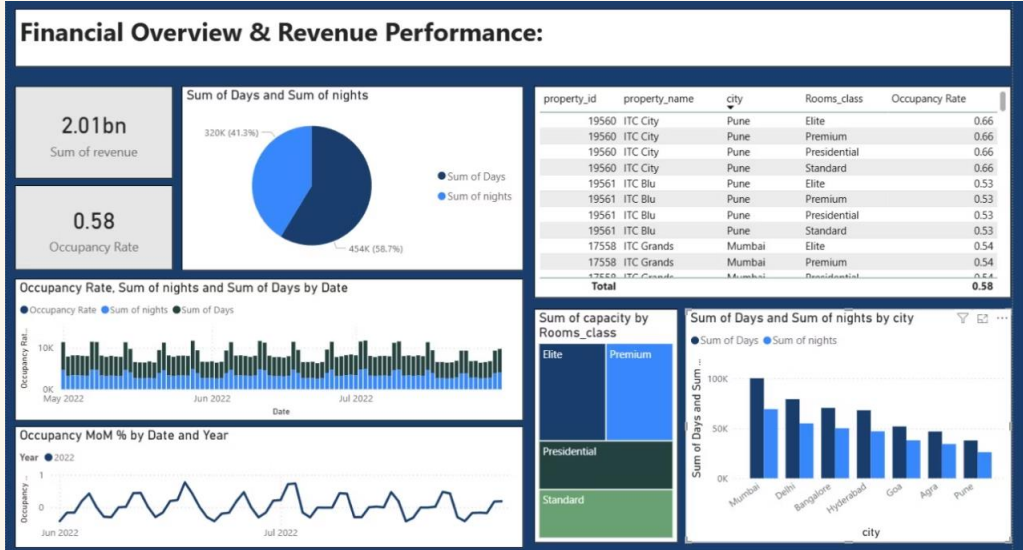

## Dashboard Designing

Multiple dashboards were created using:

- Bar charts
- Time-series line graphs
- KPI cards
- Pie charts
- Slicers for filtering

The design ensures a clean, interactive experience for decision-makers.

# Strategic Insights & Recommendations

## Strengthen Pricing Strategy

*Adjust room rates dynamically based on demand patterns, room categories, and seasonality to maximize revenue.*

## Boost Low-Performing Properties

*Identify hotels with lower occupancy and introduce promotional packages or improve service quality.*

## Improve Online Booking Channels

*Enhance digital platforms for quicker booking experiences and reduce dependency on third-party travel portals.*

## Use Seasonal Peaks Wisely

*Launch festival offers, holiday packages, and local-event promotions to increase bookings during high-demand periods.*

## Increase Guest Engagement

*Collect more guest reviews and analyze feedback to improve service quality and generate repeat bookings.*

## Better Operational Planning

*Monitor RevPAR, ADR, and occupancy together for more accurate forecasting and staffing management.*

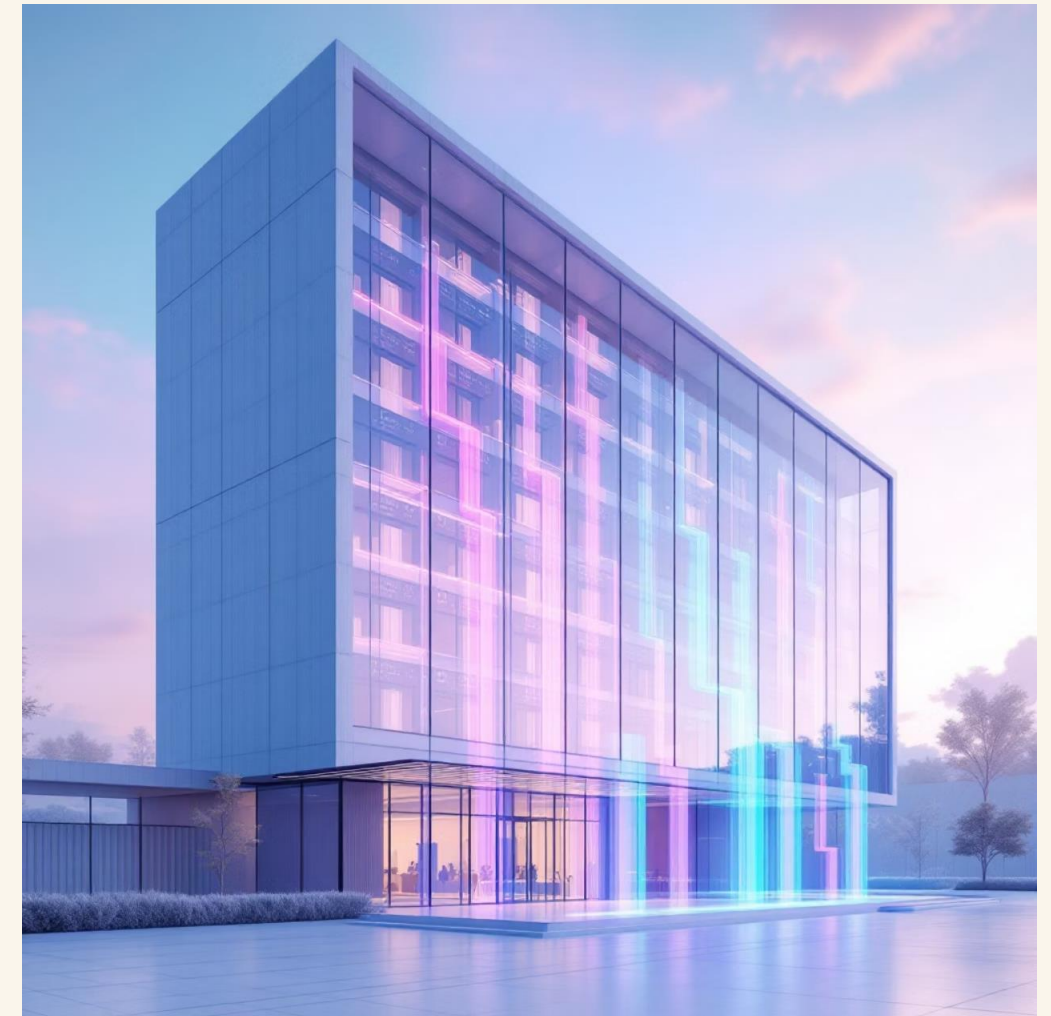

# Conclusion

*The Power BI analysis provides a comprehensive view of hotel performance across properties, room types, and customer preferences.*

*By using interactive dashboards and key performance metrics, hotel management can:*

- *Detect business trends*
- *Optimize room availability*
- *Enhance customer satisfaction*
- *Improve revenue generation*

*This project demonstrates how data analytics can support the hospitality industry in making effective and timely business decisions.*

# Future Scope

## AI-Based Forecasting

*for occupancy and revenue prediction*

## Customer Segmentation Models

*for personalized marketing*

## Competitor Benchmarking

*to compare pricing and occupancy*

## Cost Optimization Dashboards

*for operational efficiencies*

## More Advanced Feedback Analysis

*using sentiment analysis*

# Thank You
